

Per-round communication cost vs N_{clients} ($b=100$, $n_{\text{agg}}=2$, FL-SQMPC $q=2$)

Dotted vertical lines mark $N = 7, 255, 1023$. FL-SQMPC share width grows as $\text{ceil}(\log_2(N * 2^q))$ bits/share, so its per-client upload is the only client-side curve that depends on N .
