

ToN-IoT Multiclass - per-round communication vs N_clients (b=100, n_agg=2, FL-SQMPC q=2)

Dotted vertical lines mark $N = 7, 255, 1023$. FL-SQMPC share width grows as $\text{ceil}(\log_2(N * 2^q))$ bits/share, so its per-client upload is the only client-side curve that depends on N .
